

Supplementary Material for: Methodological Flexibility in the Iowa Gambling Task

Table S4.

Cluster Solutions at Fixed Correlation Thresholds and Under the Dynamic Hybrid Cut

Cut method	k clusters	Min within-cluster mean r	Max between-cluster mean r
Threshold $r = 0.9$	152	0.902	0.898
Threshold $r = 0.7$	85	0.718	0.698
Threshold $r = 0.5$	37	0.629	0.497
Threshold $r = 0.3$	13	0.403	0.280
Threshold $r = 0.1$	7	0.317	0.086
Threshold $r = 0.0$	2	0.187	-0.202
Dynamic hybrid cut	20	0.418	0.641

Note. The dynamic hybrid cut (deepSplit = 2, minClusterSize = 5) yielded 20 clusters with zero unassigned variables. At $r = 0.9$ the great majority of the 196 strategies remain unique, indicating few near-exact duplicates. The space consolidates slowly and splits into two directionally opposed mega-clusters at $r = 0.0$.
